Project Narrative

Provide a brief, concise project description no more than two sentences.

Provide a brief, concise project description no more than two sentences.

The project proposes to restore 2,000 linear feet of Beck Creek on the Weaver Farm and Brummel Property in West Cornwall Township, PA. The restoration design objectives include creating a stable C4/E4 stream channel that meanders across the center of a restored floodplain. The restoration of the floodplain involves the creation of 5.15 acres of high value emergent, scrub-shrub and forested wetlands. An open water and emergent wetland impoundment along the middle reaches will capture and treat direct runoff from adjacent cultivated fields. It will create 10.2 acres of riparian buffer that provide water quality and habitat functions.

Project Executive Summary

Project Executive Summary

The 2022 Integrated Water Quality Report lists this reach of Beck Creek as impaired with the source of impairment being agriculture and the cause of impairment being nutrients. The stream reaches through the Beck Creek 6 project area have been significantly impacted by historic relocation, straightening, unlimited livestock grazing, and removal of riparian vegetation. Runoff from cultivated fields along the adjacent western slopes has also contributed significant loadings of sediment and nutrients to the creek. Stability problems include high width to depth ratio, streambank erosion, heavy sedimentation, and aggradation (mid-channel bars) and debris jams. The increased sedimentation has significantly degraded in-stream habitat resulting in few, shallow pools and riffles that are highly embedded with fine sediments. The overwide sections immediately downstream of Route 322 and along the middle reach are choked with fine sediment, organic muck and aquatic vegetation. This reach is a significant source of sediment to downstream reaches along Beck Creek as well Quittapahilla Creek and Swatara Creek.

The Beck Creek watershed ranks as a priority subwatershed in the Quittapahilla Creek Watershed Implementation Plan (2021). In 2018, Beck Creek 6 was submitted for funding through the Water Quality Improvement Projects along the Sunoco Mariner East 2 Pipeline Corridor Grant Program. That grant application was approved in March 2019. Design plans and construction documents were completed in April 2021 and submitted to the local, state and federal permitting agencies for review and approval. E&S Plans were approved by LCCD in May 2021. The USACOE 404 permit was approved in June 2021 and the PADEP Environmental Assessment was approved in October 2021. An Invitation to Bid was sent to all interested pre-qualified contractors on May 14, 2021. Five of the six contractors invited attended a mandatory site walk on May 28, 2021. Four of the five Contractors submitted a bid proposal. Contractor bid selection occurred on June 19, 2021, and the construction cost from the lowest bidding Contractor has been inserted into this Grant Application. Doc Fritchey Trout Unlimited applied for 319 funding in 2022 for the Construction phase of the project. Because funding was not approved in 2022, Doc Fritchey Trout Unlimited is applying for Growing Greener Plus funding this year. Three of the four Contractors were queried regarding whether their 2021 bid proposal was still valid. Each Contractor indicated that due to inflation, particularly related to the cost of fuel and construction materials, their original bids would be adjusted 15 to 20%. The selected Contractor's inflation adjusted bid has been inserted into this Grant Application.

Project Narrative

The Beck Creek 6 Stream and Floodplain Restoration Project will restore 2,000 linear feet of Beck Creek. The restoration of the floodplain involves the creation of 5.15 acres of high value emergent, scrub-shrub and forested wetlands and 10.2 acres of riparian buffer that provide water quality and habitat functions. The project will reduce nitrogen, phosphorus and sediment loadings from streambank erosion by 150.0 lbs. /yr., 136.0 lbs. /yr. and 89,760 lbs. /yr., respectively. Significant additional reductions in sediment and nutrient loadings will be achieved via the open water and emergent wetland impoundment along the middle reaches that will capture and treat direct runoff from the adjacent cultivated agricultural fields. The project represents an important next step in our continuing efforts to implement those projects identified in our WIP for the Beck Creek subwatershed.

8. Impairment Sources, Causes and Measurable Environmental Benefits

a. List the Impairment Source(s), Cause(s) and Reach Code for the receiving waters of your project.

Use the latest Integrated Report to obtain this information. If a Healthy Waters Initiative, Technical Assistance, Watershed Group/Organization,

Education or Outreach or support or a statewide/regional

or countywide project, summarize impairment sources/causes (reach codes are not needed).

The 2022 Final Pennsylvania Integrated Water Quality Monitoring and Assessment Report, including the Clean Water Act Section 303(d) List indicates nutrients are the source of impairment and agriculture is the cause of these impairments. Reach Codes: Beck Creek-- 02050305001123

b. Briefly discuss how the proposed project intends to address the listed Impairment Sources and Causes. Please limit your response to 500 words or less

This project will restore/stabilize 2,000 linear feet of stream channel (4,000 linear feet of streambanks), create 5.15 acres of wetlands and 10.2 acres of riparian buffer. The water quality benefit in terms of sediment and nutrient loading reductions from addressing streambank erosion was estimated using USEPA default values to be more than 150.0 lbs. /yr., 136.0 lbs. /yr. and 89,760 lbs. /yr., respectively. Significant additional reductions in sediment and nutrient loadings will be achieved via the open water and emergent wetland impoundment along the middle reaches that will capture and treat direct stormwater runoff from the adjacent cultivated agricultural fields. In

Addenda

addition, excavating and lowering the floodplain will allow stormflows to more frequently overtop the streambanks and spread out across the restored floodplain where the created wetlands will trap sediments and uptake the nutrients conveyed from upstream in the watershed. We will develop sediment and nutrient loading reduction estimates for the channel and floodplain restoration as well as the open water wetland impoundment utilizing the Model My Watershed protocol and include those estimates in the Final Project Report.
